### Assignment 1: Smart Contract Development & Testnet

#### Deployment

Ass1 Contract ID

0x75534834EFC9899D98700e129b9F963aC3Bd54d2

[0x2c915b97639F39481Cde6eb5d31bFfE582ea5640](#)

Sepolia Testnet is a specialized test network designed for developers to experiment with and test their Ethereum-based applications and smart contracts.

#### Challenges faced:

1. Install Meta Mask: Use chrome instead of Safari on Mac.
2. Generated Ethereum faucet but was getting over when we ran contract multiple times. So imported from a different Google account.
3. Sepolia testnet takes time , so we need to wait using [sepolia.etherscan.io](https://sepolia.etherscan.io)
4. Every day went to <https://cloud.google.com/> anded Ethereum sepolia faucet to maintain balance.

Steps :

1. Create two programs, one for Assigning values and retrieving and other for Storing string and retrieving it.
2. After Compiling and deploying checked details in <https://sepolia.etherscan.io/>

#### Part 2

Mintable contract id: 0x4d97a889F9178558139C97FA34029E1c2d0D8Bce

[0x766C0EfC93D7bc744d00b3E05ff426c53307bc80](#)

ERC-20 defines a set of API methods and events to ensure that all tokens created using this standard are compatible with other Ethereum tokens

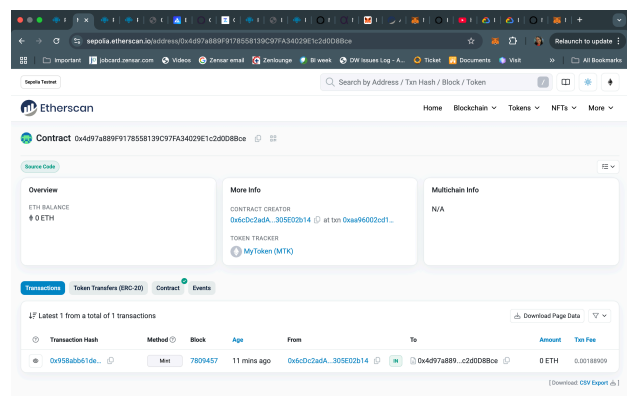

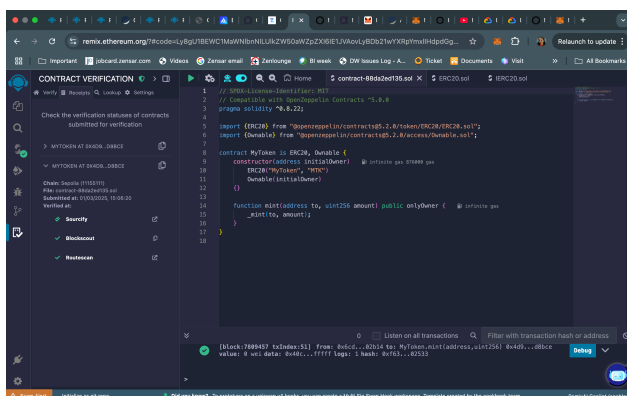

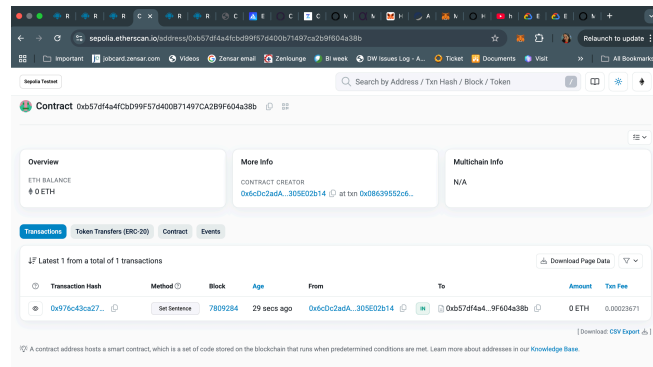

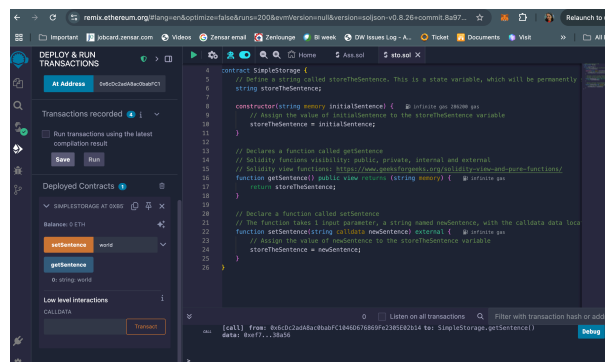

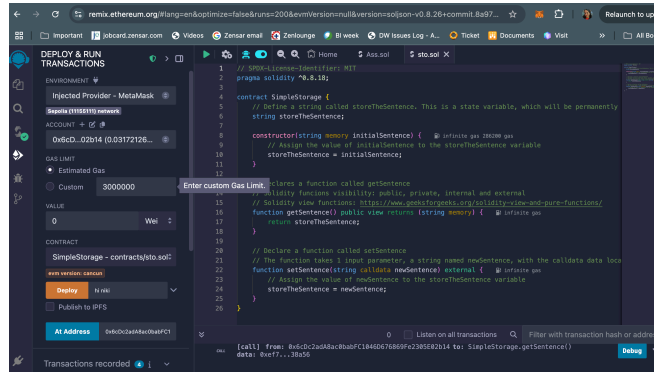

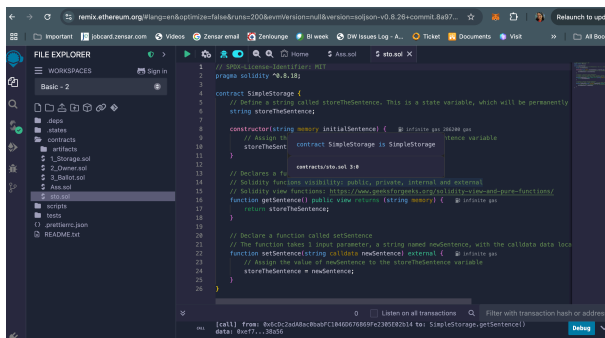

#### Steps:

Prerequisite

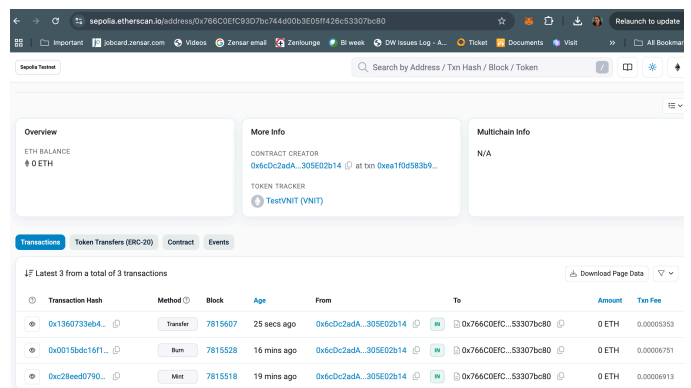

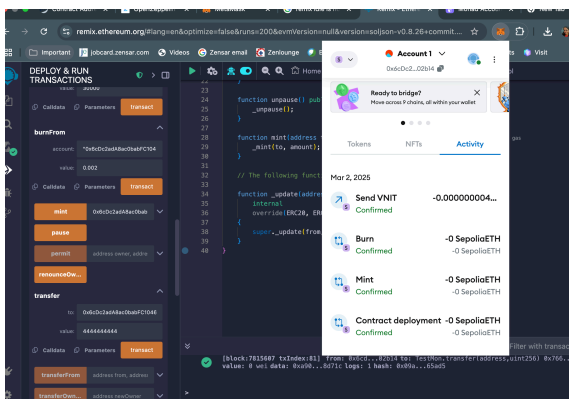

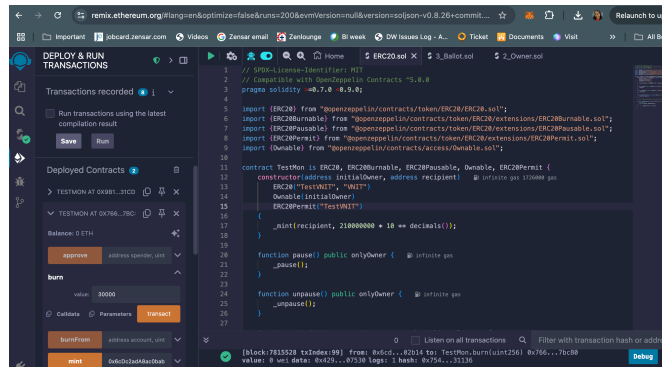

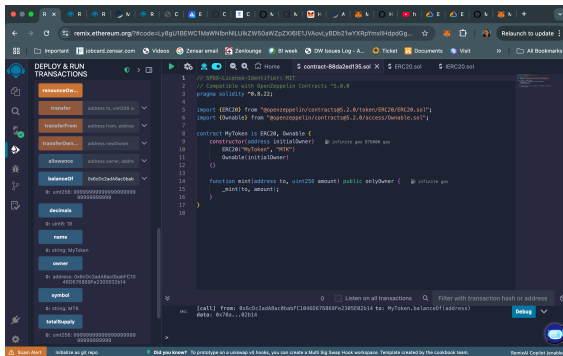

1. MetaMask should be installed and select sepolia.
2. Using [cloud.google.com](https://cloud.google.com/) , load free 0.5 Sepolia Ether faucet.
3. Select ERC20
4. Click on Mineable, Burnable
5. Click on Remix button on top right to open the code.
6. Modify the code for other functions and put
7. Save and compile the contract
8. Deploy on Injected provider meta mask

9. Select account that has more than 0.05 in Account
10. Click on Deploys Contact and select mint. Enter Address and amount to mint
11. On <https://sepolia.etherscan.io/> enter the address Deployed
12. Checked mint, burn, transfer and balance options.
13. Verified deals on <https://sepolia.etherscan.io/> and activity tab on Metamask.
14. Saved Workspace by the name of “Ether Assignment”

## ASS 3 : Voting System

### Steps

1. Create a folder Voting
2. npm init
3. npm install
4. npx hardhat
5. npx hardhat compile
6. npx hardhat run --network volta scripts/deploy.js
7. Create-react-app react-app
8. Npm start
9. Npm install ethers@5.7.1

Code is in Github:
